Canyon — Recruitment

Re: AI Engineer — Amsterdam

Tilburg, 19 August 2026

I build AI agents that run in production, alone and quickly. Citania is my own multi-tenant booking and payments SaaS: around 80,000 lines of TypeScript on PostgreSQL, 294 automated tests, contract-first OpenAPI/Zod schemas, and live integrations with OpenAI, Stripe, two-way Google Calendar and Microsoft Graph sync and inbound WhatsApp. At Netvice I introduced agentic AI development as the delivery method and used it to ship a real-time operations layer wired to telephony webhooks. Prompt design, iterating on it, and measuring whether the output actually holds up are routine work rather than a side interest.

Where I differ from your ideal profile, stated plainly: my production stack is TypeScript rather than Python with LangChain or Haystack, and I have not run Pinecone or Weaviate, formal MLOps monitoring, or CI/CD pipelines in production. I write Python for analysis and modelling, and I have built retrieval and integration layers myself rather than with an off-the-shelf framework. What I would bring on day one is agent design, prompt and guardrail work, REST/webhook integration and an unusually short distance between idea and shipped feature; the specific vector-database and MLOps tooling I would be learning, and I learn stacks fast because I have had to.

The e-commerce and customer-facing angle suits me. My economics background means I think about what a system is worth before how to build it, and my analytics year was spent making tooling that people on a floor actually used — which is the same test an agent faces with real riders and real service teams.

Practical notes: one year of professional experience; working language English, Dutch at A2 and improving; and I am a non-EU national on a Dutch highly-skilled-migrant permit, so Canyon's Dutch entity would need to take over the sponsorship. Everything above is live and clickable at franciscorau.com, and I would gladly walk you through the Citania codebase.
