Schuberg Philis — Recruitment

Re: GenAI Python Engineer — Schiphol-Rijk

Tilburg, 20 August 2026

I build GenAI applications and put them into production alone. Citania is my own multi-tenant booking and payments SaaS — roughly 80,000 lines of production TypeScript on PostgreSQL, 294 automated tests, contract-first OpenAPI/Zod schemas, database-level exclusivity guarantees, and live integrations including OpenAI. At Netvix I introduced agentic AI development as a delivery method and used it to ship a real-time operations layer wired to telephony webhooks. Prompt design, iteration and measuring whether output actually holds up are routine work for me rather than novelty.

The honest gap, stated first because you will find it anyway: your ad asks for GenAI applications built and maintained in production with Python, and my production stack is TypeScript. I write Python for analysis, modelling and data pipelines — a 10,605-business market study, statistical modelling on multi-year datasets, calibrated probability models validated out-of-sample — but I have not run a Python GenAI service in production, and I have not used the mainstream GenAI frameworks in anger. If that is a hard requirement, I would rather you know now.

What I would argue is worth a conversation anyway: the thing that transfers is not the language, it is the habit of building for reliability. My own SaaS was written test-first with permissions, validation and error paths designed in from the start, because I am the only person who would be paged for it. That instinct is what mission-critical work seems to demand, and it is the part that took longest to learn — Python syntax is not.

Schiphol-Rijk is a straightforward commute. Everything above is live and clickable at franciscorau.com, and I would happily walk your team through the Citania codebase or the agentic tooling I use daily.
