Parker — Recruitment

Re: Data Analyst I

Tilburg, 15 September 2026

Most analyst jobs hand you the measure already decided. In my year at Netvice, a Dutch contact-centre company, the project I proposed and am proudest of was the opposite: a percentile-based performance metric that scores each result against the distribution of its own workload, so people doing genuinely different work stay comparable. A scoring problem, structurally.

The modelling was the easy half. The hard part was defending the definition to everyone it touched, and being able to say precisely what it did and did not capture. I also built the demand forecast that fed capacity and hiring planning.

AI-first output is only as good as whoever audits it. On Alpha Scout, my live football player-valuation platform, I audited my own backtest and found a stale price sitting in a denominator and a date leak in the calendar-year leagues. The multiple advantage I had published — 3.48x for my picks — did not survive: measured against the right price it is 1.17x, which is noise. What survived was frequency, not price. I replaced the headline with the smaller true one. That is the standard I would hold a credit or fraud metric to.

My SQL is working-level and used daily — I write the queries behind production reporting, and joins and data modelling are where I am strongest. Query-plan tuning is the part I am still building. How I work, plainly: I work with agentic tooling — I write the spec, direct the model, and own the test suite. The 294 tests in Citania, the multi-tenant booking platform I am building, exist because I decided the test suite was the contract. Everything is at franciscorau.com. Based in Tilburg, available immediately.
