Xccelerated / Xebia — Recruitment

Re: AI Engineer — Eindhoven region

Tilburg, 15 September 2026

My degrees are economics and data science, so the translation between a business problem and a technical one is the part of this job I go looking for, not the part I tolerate. That is also the part that decides whether an AI project is worth building at all.

I spent the past year as Data & Process Analyst at Netvice, a Dutch contact-centre company, where my work covered the full chain: requirements, data model, pipeline, metric design, and the dashboard people actually opened. On my own I built and run two systems: Citania, a multi-tenant SaaS on PostgreSQL with 294 automated tests and contract-first schemas, which I designed, built, tested and run on my own, pre-launch, and Alpha Scout, a live football player-valuation platform I took from raw data through to calibrated probabilities. Both are at franciscorau.com.

On your not-your-dream-job list, the geography one deserves a straight answer: I live in Tilburg, one direct train from Eindhoven, and being on site with clients every day is fine by me — it is the part of consulting I want.

One habit I would bring. On Alpha Scout I audited my own backtest and found a stale price sitting in a denominator and a date leak in the calendar-year leagues. The multiple advantage I had published — 3.48x for my picks against 2.80x for the pool — did not survive: measured against the right price it is 1.17x against 1.08x, which is noise. What survived was frequency: 50.3% of my picks were sold inside 24 months against 30.5% of the pool. I replaced the headline with the smaller true one. How I work, plainly: I architect, direct, test and run with agentic tooling — the 294 tests in Citania exist because I decided they would, and I am happy to walk your engineers through the architecture. Available immediately.
