Polarsteps — Recruitment

Re: Data Scientist, Growth Analytics — Amsterdam

Tilburg, 15 September 2026

Most analytics roles quietly skip the measurement part. Yours names it, which is why I studied economics before data science.

A year as Data & Process Analyst at Netvice, a Dutch contact-centre company: I designed a percentile-based performance metric that scores results against the distribution of each workload, so people doing different work stay comparable, and I built the demand forecast that capacity and hiring planning ran on, out to a 500+ day horizon. Both were projects I raised myself and carried through to daily use. Python, SQL, and enough engineering to build the thing rather than specify it. Alpha Scout, my live player-valuation platform, is at franciscorau.com.

The constraint I would want to look at first is the shape of your own product. Plan, track, relive is three different usage regimes with very different frequencies: tracking is dense and bounded by the trip itself, planning is bursty and happens before, and the Travel Book is a revenue event that lands after the trip is over. So the growth question I would start on is not how to raise engagement in general but what happens between trips, and what turns a finished trip into a book.

On being hard on my own numbers. On Alpha Scout I audited my own backtest and found a stale price sitting in a denominator and a date leak in the calendar-year leagues. The multiple advantage I had published — 3.48x for my picks against 2.80x for the pool — did not survive: measured against the right price it is 1.17x against 1.08x, which is noise. What survived was frequency: 50.3% of my picks were sold inside 24 months against 30.5% of the pool. I replaced the headline with the smaller true one. Based in Tilburg, available immediately.
